HOMOGENEOUS SYMMETRIC FUNCTIONS

1. Homogeneous family

A homogeneous symmetric function with a single integer index, n, is the sum of all monomials of homogeneous degree n. That is,

$$x_1^{n_1} x_2^{n_2} \cdots x_d^{n_d}$$

has homogeneous degree n if the total degree $n_1 + \cdots + n_d = n$. In terms of monomial symmetric functions,

$$\mathbf{h}_n = \sum_{\lambda \vdash n} \mathbf{m}_{\lambda}$$

The homogeneous symmetric function indexed by λ is the product of the corresponding single-indexed functions:

$$\mathbf{h}_{\lambda} = \mathbf{h}_{\lambda_1} \mathbf{h}_{\lambda_2} \cdots \mathbf{h}_{\lambda_L} = \mathbf{h}_1^{\rho_1} \mathbf{h}_2^{\rho_2} \cdots \mathbf{h}_n^{\rho_n} = \mathbf{h}^{\rho}$$

in multi-index notation. Taken together $\{h_{\lambda}\}_{\lambda}$ form a basis for the symmetric functions under consideration.

We have the expansion in terms of monomial symmetric functions.

Proposition 1.1. For given partitions λ , μ , let $S_{\lambda\mu}$ denote the number of nonnegative integer matrices with row sums λ_i and column sums μ_j , respectively. Then we have

$$\mathbf{h}_{\lambda} = \sum_{\mu} S_{\lambda\mu} \mathbf{m}_{\mu}$$

In fact, the transition matrix $S_{\lambda\mu}$ is symmetric.

1.1. **Diagrams.** The homogeneous symmetric functions correspond to single-rowed SSYT's. E.g., h_4 is the sum of all SSYT's with shape

For d=2, we have

$$\mathbf{a}_3 = \begin{bmatrix} 1 & 1 & 1 & 1 & 2 \\ & 1 & 1 & 1 \end{bmatrix} + \begin{bmatrix} 1 & 1 & 2 \\ & 1 & 2 \end{bmatrix} + \begin{bmatrix} 1 & 2 & 2 \\ & 2 & 2 \end{bmatrix} = \begin{bmatrix} 2 & 2 & 2 \\ & 2 & 2 \end{bmatrix}$$

the diagrams indicating the corresponding monomials.

Proposition 1.2. The number of terms in h_n is

$$\#\mathbf{h}_n = \binom{n+d-1}{n}$$

Proof. The number of monomials of degree n in d variables is the coefficient of v^n in the expansion of $(1-v)^{-d}$, namely $\frac{(d)_n}{n!}$ which rearranges accordingly.

Example. For d = 2, n = 3, we get

$$\#\mathbf{h}_3 = \binom{4}{3} = 4$$

as seen above.
